Text extraction

Recently, significant accuracy improvement has been achieved for acoustic recognition systems by increasing the model size of Long Short-Term Memory (LSTM) networks. Unfortunately, the everincreasing size of LSTM model leads to inefficient designs on FPGAs due to the limited on-chip resources. The previous work proposes to use a pruning based compression technique to reduce the model size and thus speedups the inference on FPGAs. However, the random nature of the pruning technique transforms the dense matrices of the model to highly unstructured sparse ones, which leads to unbalanced computation and irregular memory accesses and thus hurts the overall performance and energy efficiency.

Problems faced

Give examples of:

- Equation conversion
- Figure conversion
- White space
- ► Merged words
- ▶ Page Columns
- ► Time

dependencies between operator are complicated. So, it is difficult circulant matrix [22]. The circulant matrix is a square matrix, of which each now (column) weeter is the circulant reformat of the (vector) size is it. Since the compressed weight matrices are still

complexity from O(k2) to O(klogk). which are (1) template generation and (2) automatic LSTM synthewe use an accurate performance and resource model to enable a

· We employ the block-circulant matrices based structured compression technique for LSTMs which largely reduces

of the LSTM models.

• We develop a general LSTM optimization and synthesis

Figure 1: An LSTM based ENN architecture The framework mainly consists of a suite of highly opti-. We present efficient implementations of LSTMs which achieve

2 LSTM BACKGROUND

LSTM is a key component of the acoustic model in modern largewe use a widely deployed variant called Google LSTM [25] as an

> $i_\ell = \sigma(\mathbf{W}_{1\ell}\mathbf{x}_\ell + \mathbf{W}_{1r}\mathbf{y}_{r-1} + \mathbf{W}_{1r}\mathbf{c}_{r-1} + b_1).$ $\mathbf{f}_{d} = \sigma(\mathbf{W}_{f,r}\mathbf{x}_{d} + \mathbf{W}_{f,r}\mathbf{y}_{T-1} + \mathbf{W}_{f,r}\mathbf{c}_{T-1} + \mathbf{b}_{f}),$ (110) r. = c(W-x-+W-y-+h-) $c_1 = f_1 \odot c_{1-1} + g_1 \odot i_1.$ $\mathbf{e}_{z} = \sigma(\mathbf{W}_{av}\mathbf{x}_{r} + \mathbf{W}_{av}\mathbf{y}_{s-1} + \mathbf{W}_{av}\mathbf{e}_{r} + \mathbf{b}_{a}),$ (lie)

 $m_s = o_s \odot h(c_s)$. $\mathbf{x}_{i} \equiv \mathbf{W}_{i-1}\mathbf{w}_{i}$

forget gate, output gate, cell state, cell output, and a projected outdenote weight matrices (e.e. W ... is the matrix of weights from

¹ This estimation considers both weights and indices (there is at least one index per weight after compression in ESE). However, this is a pessimistic estimation for ESE because indices can use fewer bits for representation than weights;

the ADM-7v3 platform. Compared with ESE, we oblive 10.2X and 18.4X performance proclups and 19.1X and 33.5X energy efficiency gains using FFFs and FFF16, respectively. Since the power committee of Col. 175 in each plat of the ESE, the energy efficiency engine is higher than performance. It is necessary to note that as shown in Table 2, the manufacturing process of XCRUGO PFC4A col. 18.1X and 19.1X and 1

Although the promising performance and energy gains are achieved by C-LSTM, the resource utilization for LUT, FF, and BRAM are less than ESE, and more important, the relative PER degradation is very small, which are 0.32% and 1.23% using FFT8 and FFT16, respectively. After detailed analysis, we summarize the fundamental reasons for the high performance and power gains in three aspects. First, the structured compression used in this work eliminates the irregular computation and memory accesses which not only makes the design more regular but also exposes more parallelism. This could be verified in that the DSP resource consumption of the proposed method is much more than ESE. Secondly, the whole model (weights matrices and the projection matrix) could be stored onchip without fetching data from off-chip DRAM, making the LSTM not bounded by memory. Lastly, the more efficient implementation of LSTM on FPGAs contributes to the high efficiency. For example, we use the 22-segment piece-wise linear function to approximate the activation functions while ESE employs look-up tables which break the activation down into 2045 seements and consume more resources, Moreover, we propose to employ FFT based block-circulant

matrix multiplication while ESE uses sparse matrix multiplication which needs to store extra indices for sparse matrices and thus neevents from storing the whole model on-chip.

6.3 Experimental Results of Small LSTM In order to validate that proposed C-LSTM is not only appropriate

for Google LSTM model, we also implement a Small LSTM [20] model on both PEAQ paliforms.

In KUGO platform, the FFT8 and FFT16 designs could achieve platk and the performance special compared with ESE, respectively, in the ADM-TV3 platform, the performance specialps are 125X and 135X performance specialpo compared with ESE, respectively. In the ADM-TV3 platform, the performance specialps are 125X and 135X performance specialps are 125X and 135X performance specialps are 125X and 135X performance special part of the 125X performance special performance special

7 RELATED WORK

Recently, FIXAh has energed as a promising hardware acceleration platters for DNNs in provise high performance, two power and reconfigurability. A to of FIXAh based accelerates have been proposed for convolutional neural networks (CNNs) to reverome the computing and energy efficiency shallenges, [23] proposes to utilties systelia erraly based convolutions architecture to achieve better foregariny and thus performance for CNNs on FIXAh. [13] required to the Wassignal algorithm to return the remisiplation operators are the Wassignal algorithm to return the multiplation operators are [30] proposes to take advantage of the Interruptroom algorithms to maximize the reservoir utilization for convolutional process.

This justimation considers both weights and indices (there is at least one index per weight after compression in ISS), bowers, this is a periodic estimation for SE because indices can use fewore bits for representation than weights, matrix multiplication wided for representation than weights, matrix multiplication wided medic to store set an indices for gazars matrix est and thus prevent from storing the whole model to rights the ADM-Ya) platform. Compared with ISS, we achieve 10.2X and 18.8X performance speedups and 19.1X and 19.3X content of the proper district position with present properties of the properties of
